

N-Channel Synchronous MOSFETs With Break-Before-Make

DESCRIPTION

The Si4724CY N-Channel synchronous MOSFET with break-before-make (BBM) is a high speed driver designed to operate in high frequency DC/DC switchmode power supplies. It's purpose is to simplify the use of N-Channel MOSFETs in high frequency buck regulators. This device is designed to be used with any single output PWM IC or ASIC to produce a highly efficient low cost synchronous rectifier converter. A synchronous enable pin (disable = low, enable = high) controls the synchronous function for light load conditions.

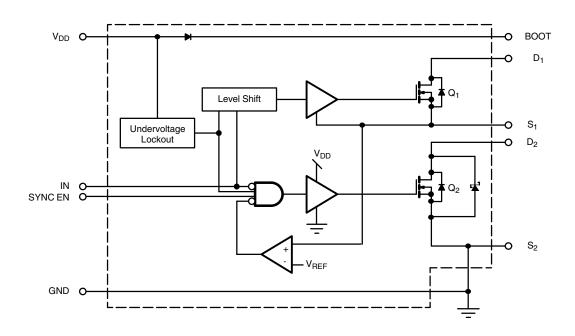

The Si4724CY is packaged in Vishay Siliconix's high performance LITTLE FOOT® SO-16 package.

FEATURES

- 0 V to 30 V operation
- Driver impedance-3
- Undervoltage lockout
- Fast switching times
- 30 V MOSFETs
- High side: 0.0375 at $V_{DD} = 4.5$ V
- Low side: 0.029 at $V_{DD} = 4.5 \text{ V}$
- Switching frequency: 250 kHz to 1 MHz
- Integrated schottky

Notes:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

a. Surface mounted on 1" x 1" FR4 board.

b. Junction-to-foot thermal impedance represents the effective thermal impedance of all heat carrying leads in parallel and is intended for use in conjunction with the thermal impedance of the PC board pads to ambient ($R_{th,JA} = R_{th,JF} + R_{th,PCB-A}$). It can also be used to estimate chip temperature if power dissipation and the lead temperature of a heat carrying (drain) lead is known.
